

Chapter 13: Mass spectrometry and Infrared spectroscopy

Learning Objectives:

1. Be able to predict the fragmentation patterns expected to arise in the mass spectrum of alkanes, alkyl halides, ethers, alcohols, and ketones.
2. Be able to describe what happens to a compound in a mass spectrometer
3. Be able to use the mass spectrum of a compound to find the molecular mass, and to help identify the structure of a compound.
4. Be able to describe what happens to a compound when it absorbs infrared radiation.
5. Be able to use of a chart of functional group IR absorptions, and to help identify the structure of a compound.
6. Be able to use result from elemental analysis to deduce the number of carbon, hydrogen, and nitrogen in the molecular formula.*

* Supplemental material, not included in the textbook

Sections:

- 13.1 Mass Spectrometry
 - 13.2 The Mass Spectrum – Fragmentation
 - 13.3 Isotope in Mass Spectrometry
 - 13.4 Determination of Molecular Formulas: High-Resolution Mass Spectrometry
 - 13.5 Fragmentation at Functional Groups*
 - 13.6 Spectroscopy and the Electromagnetic Spectrum[#]
 - 13.7 Infrared Spectroscopy
 - 13.8 Characteristic Infrared Absorption bands
 - 13.9 The Intensity of Absorption bands[#]
 - 13.10 The position of Absorption bands
 - 13.11 C-H Absorption Bands
 - 13.12 The Shape of Absorption Bands*
 - 13.13 Absence of Absorption Bands[#]
 - 13.14 Infrared Inactive Vibrations[#]
 - 13.15 Identifying Infrared Spectra
- Additional material: Calculation of molecular formula using information from mass spectrometry and elemental analysis

* Sections that will be focused

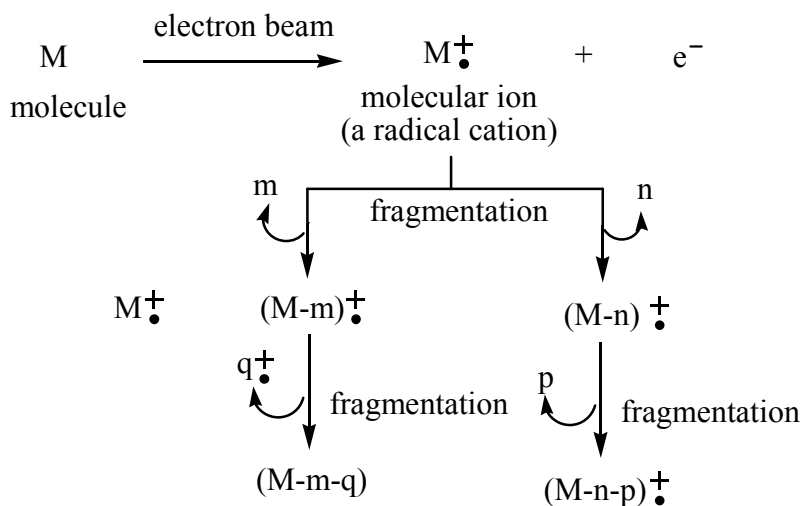

[#] Sections that will be skipped

Recommended additional problems

32, 45, 46, 50, 51, 54

Class Note

13.1 Mass Spectrometry and 13.2 The Mass Spectrum – Fragmentation

Cations detected by collector: M^+ $(M-m)^+$ $(M-n)^+$ $(M-n-p)^+$ q^+

- A. Most of the instrument is designed to detect cations.

- B. Relative abundance of fragmentation pattern depends on the energy of the electron beam.

13.3 Isotope in Mass Spectrometry

A. Relative abundance of carbon on molecular ion

Each carbon contributes 0.011 abundance to the abundance of M+1 peak =>

$$\begin{aligned} \text{relative abundance of M+1 peak} = \\ (\text{number of carbon in the analyzed molecule}) \times \text{relative abundance of M} \times 0.011 \end{aligned}$$

$$\begin{aligned} \Rightarrow (\text{number of carbon in the analyzed molecule}) = \text{relative abundance of M+1 peak} \\ \div (\text{relative abundance of M} \times 0.011) \end{aligned}$$

* Not very accurate for compound with high molecular weight

Example: M (150): 16.28 and (M+1) (151): 1.66

B. Relative abundance of Cl on molecular ion

^{35}Cl : 75.77% (0.76) ^{37}Cl : 24.23% (0.24)
(M) (M+2)

For compound with one Cl: $M/(M+2) \approx 3/1$

C. Relative abundance of Br on molecular ion

^{79}Br : 50.69% (0.51) ^{81}Br : 49.31% (0.49)
(M) (M+2)

For compound with one Br: $M/(M+2) \approx 1/1$

13.4 Determination of Molecular Formulas: High-Resolution Mass Spectrometry

Use Table 13.3

13.5 Fragmentation at Functional Groups*

A. Alkyl halides ($\text{CH}_3\text{CH}_2\text{CH}_2\text{Br}$ and $(\text{CH}_3)_2\text{CHCl}$)

B. Ethers ($\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{OCH}(\text{CH}_3)_2$)

C. Alcohols ($\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}(\text{OH})\text{CH}_3$)

D. Ketones ($\text{CH}_3\text{CH}_2\text{CH}_2\text{COCH}_3$)

13.7 Infrared Spectroscopy

Figure 13.12 (stretching and bending)

13.8 Characteristic Infrared Absorption bands

Table 13.4 (OH, NH, and C=O)

13.10 The position of Absorption bands

A. Effect of mass

B. Effect of bond order

D. Effect of resonance and inductive effect

acyl halide > ester > aldehyde > ketone > amide

13.11 C-H Absorption Bands

* NMR provides more reliable characterization.

13.12 The Shape of Absorption Bands

NH, NH₂, OH, and CO₂H

13.15 Identifying Infrared Spectra

C=O and H-bond

Additional material: Calculation of molecular formula using information from mass spectrometry and elemental analysis

A. Example 1

From Mass Spec M^+ : 99

From elemental analysis: C: 60.5%; H: 9.1%; N: 14.1%

B. Example 2

From Mass Spec M^+ : 142, relative intensity: $(M^+)/(M+2)^+ = 100/35$

From elemental analysis: C: 58.9%; H: 4.9%
